The invention relates to Robinia pseudoacacia lectins which can be used in medicine. The lectin is used for the control of mucosal call proliferation, for the reduction and/or treatment of damage caused by cell damaging agents, especially in the treatment of cancer, and/or for the reduction and/or treatment of metabolic disorders. It is especially
                                                                                                                                                                                                                                                                                                                                                                                                                                  useful for the treatment of mucositis in mammalian cells and/or tissues, particularly human cells and/or tissues (especially mucous cells including mucous membrane). Use of the lectin is effective and does not damage the gut as is the case with cytotoxic drugs and radiation. The present sequence represents a polypeptide subunit of R. pseudoacacia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               62 SMA-VSSFETNLTIQISTPHPYYAADGFAFFLAPHDTVIPPNSWGKFLGLYSNVFRNSPT 120

The invention relates to Robinia pseudoacacia lectins which can be used proliferation. The lectin is used for the control of mucosal cell proliferation, for the reduction and/or treatment of damage caused by cell damaging agents, especially in the treatment of cancer, and/or for the reduction and/or treatment of metabolic disorders. It is especially particularly human cells and/or tissues (especially mucous membrane). Use of the lectin is effective and does not damage the gut as is the case with cytotoxic drugs and radiation. The present sequence represents a R. pseudoacacia lectin RPbAI. This lectin is composed of two subunits polypeptide a and polypeptide bectin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   62 SMA-VSSFETNLTIQISTPHPYYAADGFAFFLAPHDTVIPPNSWGKFLGLYSNVFRNSPT 120

The invention relates to Robinia pseudoacacia lectins which can be used proliferation. The lectin is used for the control of mucosal cell proliferation, for the reduction and/or treatment of damaging agents, especially in the treatment of cancer, and/or for the reduction and/or treatment of metabolic disorders. It is especially particularly human cells and/or tissues, particularly human cells and/or tissues (especially mocous cells and/or tissues including mucous membrane). Use of the lectin is effective and does not present sequence represents a polypeptide subunit of R. pseudoacacia lectin RPbAI.

                                                                                                                                                                                                             The invention relates to Robinia pseudoacacia lectins which can be used In medicine. The lectin is used for the control of mucosal cell proliferation, for the reduction and/or treatment of damage caused by cell damaging agents, especially in the treatment of cancer, and/or for the reduction and/or treatment of metabolic disorders. It is especially useful for the treatment of mucositis in mammalian cells and/or tissues, particularly human cells and/or tissues (especially mucous membrane). Use of the lectin is effective and does not including mucous membrane). Use of the lectin is effective and does not damage the gut as is the case with cytotoxic drugs and radiation. The present sequence represents as R. pseudoacacia lectin RPBAII. This lectin is composed of the subunit- polypeptide c (AAY06813).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SMA-VSSFETNLTIQISTPHPYYAADGFAFFLAPHDTVIPPNSWGKFLGLYSNVFRNSPT 120

Lincoln lectin. The invention relates to: a transformed Brassica plant that is resistant to certain insect pests; an expression cassette containing DNA that codes for at least 1 lectin selected from Con A (see AAY58737) and pea lectin; transgenic plant cells containing at least 1 copy of the DNA; a new lectin derived from the jack bean Con A gene, a method of imparting resistance to insects selected from blossom beetles (pollem bettles) of the genus Meligetthes, flea beetles of the genus Meligetthes, flea beetles of the genus phyllotreta, and root flies of the genus Delia; and a method for protecting a plant against infestation by insects of these genera.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       2 QSLSFNFTKFDLDQKDLIFQGDATSTNNVLQLTKLDSGGNPVGASVGRVLFSAPFHLWEN 61

The sequences given in AAR74763-70 represent various pentraxins and legume lectins. All these proteins show structural homology and may be used in the molecular design of a molecule for the inhibition of serum amyloid P (SAP) binding to amyloid fibrils. The similarities in the amino acid sequences of SAP, human and Limulus C-reactive protein (RPP) and female hamster protein suggests that they may have similar 3-D structures. The jellyroll topology of the pentraxins is reminiscent of the picornavirus coat proteins which also have pentameric Structures. However, pentaxins resemble more closely legume lectins such as concanavaline A and pea lectin. Alignment of sequences on the basis of topologically equivalent features of the three dimensional structures shows that helices occupy different positions in the pentraxins and legume lectins and that the amino acid sequences of the two families have identities of only approx. 11% The positions in RAP occur before and after strand L, whereas the helices in RAP occur before and after strand J. whereas the helices in the legume lectins occur at the C-terminus of strand J. There is a long insertion between the end of the helix after strand C and the begining of strand E in the lectins relative to pentraxins. Strands G, H and I together with the type IV beta-hairpin between H and I are identical in both SAP and pea lectin. The so-called pentraxin octapeptide signature sequence, HXXXS/TWXX, is in this region so it is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     85 ADGFAFFLAPHDTVIPPNSWGKFLGLYSNVFRNSPTSENQSFGDVNTDSRVVAVEFDTFP 144

```
The invention describes compounds derived from Bauhinia purpurea lectin ((BPL), a 262 amino acid peptide comprising 7 lysine residues - the present sequence) by the replacement of one or more lysine residues with other amino acid residues which either preserve the positive charge or provide a neutral residue at the point of substitution. The compounds are useful as larvicides against insects such as the European corn borer control or a sagination insect larvae infestation, especially by the European corn borer corn borer. The BPL-derivatives are effective against insects which may be resistant to the naturally occurring form of BPL. Crops which may be protected using the BPL derivatives are corn/maize (2em mays), rye, can borer the BPL-derivatives are corn/maize (2em mays), rye, be protected using the BPL derivatives are corn/maize (2em mays), rye, can be resistant to the naturally occurring form of BPL. Crops which may be resistant to the naturally occurring form of BPL. Crops which may be protected using the BPL derivatives are corn/maize (2em mays), rye, can lilet, rice, triticale, sunflower, alfalfa, rapeseed and soybean), fiber crops (such as cotton), fruit crops (such as melons) and vegetable crops (such as onion, pepper, tomato, cucumber, squash, carrot, crucifer (e.g. cabbage, broccoll and cauliflower), eggplant, spinach, pottan, of entuce). The compounds are useful for protecting species from the genera (Citrus, Linum, Garanium, Manicum, Danicum, Danicum, Danicum, Helianthus, CC Letucea, Bromus, Atropa, Capsicum, Datura, Hyoscyamus, Lycopersicon, Nicotiana, Solanum, Petunia-tum, Hannoulus, Senecio, Salpiglossis, Cactumis, Browallia, Glycine, Lolium, Triticum and batura. The present sequence represents the B. purpurea native lectin sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   77 -STPHPYYAADGFAFFLAPHDTVIPPNSWGKFLGLYSNVFRNSPTSENQSFGDVNTDSRV 135

UGEON W., OGGAWA H., MAISUMOTO I., SENO N.;

A novel mannose-specific and sugar specifically aggregatable lectin from bark of a Japanese pagoda tree (sophora japonica).";

J. Biol. Chem. 266:3146-3135(1991).

-!-FUNCTION: MANNOSE/GIUCOSE-BINDING BARK LECTIN DISPLAYS
HERAGGIUTINATING ACTIVITY AT PH 5-10, WITH A PH OFTIMUM AT 8-9.

-!-FUNCTION: BARK LECTINS ARE STORAGE PROFEIN THAT PROBABLY MAINTAINS
STOCKS OF NITROGEN DURING DORMANT PERIOD. SELF-AGGREGATABLE
MOLECULES THAT CAN BIND THEIR OWN CARBOHOPDRATE SIDE CHAINS. THEY
COULD ALSO PLAY A ROLE IN THE PLAMY'S DEFENCE AGAINST PHYTOPHAGOUS
INVERTEBRALES OR HERRIVOROUS HIGHER ANIMALS.
                                                                                                                                                                                                                     SUBUNIT: COMPOSED OF FOUR SUBUNITS OF ABOUT 30 KDA WHICH ARE POST-TRANSLATIONALLY CLEAVED INTO A TWO SMALLER POLYPEPTIDES: A2 AND
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 NSMA-VSSFETNLTIQISTPHPYYAADGFAFFLAPHDTVIPPNSWGKFLGLYSNVFRNSP 119

WA MOVED MEANORS-SPECIFIC and Sugars specifically aggregatable lectin from bark of the Japanese pagoda tree (sophora japonica).";

J. Biol. Chem. 266:3146-3153(1991).

-!- FUNCTION: MANNOSE/GLUCOSE-BINDING BARK LECTIN. DISPLAYS

-!- FUNCTION: MANNOSE/GLUCOSE-BINDING BARK LECTIN. DISPLAYS

-!- FUNCTION: BARK LECTINS ARE STORAGE PROTEIN THAT PROBABLY MAINTAINS

STOCKS OF WITROGEN DURING DORMANT PERIOD. SELF-AGREGATABLE

MOLECULES THAT CAN BIND THEIR OWN CARBOHYDRATE SIDE CHAINS.

COULD ALSO PLAY A ROLE IN THE PLANT'S DEFENCE AGAINST PHYTOPHAGOUS

INTERTBRATES OR HERBIYOROUS HIGHER ANIMALS.

-!- SUBUNIT: COMPOSED OF FOUR SUBUNITS OF ABOUT 30 KDA WHICH ARE POST-

TRANSLATIONALLY CLEAVED INTO A TWO SMALLER POLYPEPTIDES: AI AND
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        207 GVEATANISYNPVSORLTAVSSYPNSEPITVHYDIDLKTVLPEWVRVGFSASTGENVEIN 266

-! FUNCTION: BERK LECTINS ARE STORAGE PROTEIN THAT PROBABLY MAINTAINS STOCKS OF NITROGEN DURING DORMANT PERIOD. SELE-AGGREGATABLE MOLECULES THAT CAN BIND THEIR OWN CARBOHYDRATE SIDE CHAINS. THEY COULD ALSO PLAY A ROLE IN THE PLANT'S DEFENCE AGAINST PHYTOPHAGOUS INVERBRAPES OR HERBIYOROUS HIGHER ANIMALS (BY SIMILARITY).

-!- SUBUNIT: HOMOTERRAMER OR HETEROTFTRAMER OF MAHB AND MALB SUBUNITS.
                                                                                                 van Damme E.J.M., Van Leuven F., Peumans W.J.;

"A lectin and a lectin-related protein are the two most prominent proteins in the bark of yellow wood (Cladrastis lutea)."; plant Mol. Biol. 29:799-598(1995).
-!- FUNCTION: MANNOSE/GLUCOSE BINDING BARK LECTIN.
-!- FUNCTION: BARK LECTINS ARE STORAGE PROTEIN THAT PROBABLY MAINTAINS STOCKS OF NITROGEN DURING DORMANT PERIOD. SELF-AGGREGATABLE MOLECULES THAT CAN BIND THEIR OWN CARBOHYDRATE SIDE CHAINS. THEY COULD ALSO PLAY A ROLE IN THE PLANT'S DEFENCE AGAINST PHYTOFHAGOUS INVERTEBRATES OR HERBIVOROUS HIGHER ANIMALS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (OR OTHER TRANSITION METAL) ION

The protein and a lectin-related protein are the two most prominent proteins in the bark of yellow wood (Cladrastis lutea).";

Proteins in the bark of yellow wood (Cladrastis lutea).";

Plant Mol. Biol. 29:579-598 (1995).

-!- FUNCTION: BARK LECTINS ARE STORAGE PROTEIN THAT PROBABLY MAINTAINS STOCKS OF NITROGEN DURING DORMANT PERIOD. SELF-AGERGEATABLE MOLECULES THAT CAN BIND THEIR OWN CARBOHYDRATE SIDE CHAINS. THEY COULD ALSO PLAY A ROLE IN THE PLANT'S DEFENCE AGAINST PHYTOPHAGOUS INVERTEBRATES OR HERBIVOROUS HIGHER ANIMALS.

-!- SUBBUNIT: HOMOTETRAMER OF FOUR 32 kba MONOMERS WHICH ARE POST-

TRANSLATIONALLY CLEAVED INTO A TWO SUBUNITS: A AND B.

-!- SUBLAND ONE CALCIUM ION. THE METAL IONS ARE ESSEMTIAL FOR THE AND ONE CALCIUM ION. THE METAL IONS ARE ESSEMTIAL FOR THE STAND AND CELL-AGGLUTINATING ACTIVITIES (BY

MOLECULES THAT CAN BIND THEIR OWN CARBOHYDRATE SIDE CHAINS. THEY COULD ALSO PLAY A ROLE IN THE PLANT'S DEFENCE AGAINST PHYTOPHAGOUS INVERTEBRATES OR HERBIVOROUS HIGHER ANIMALS.

-!- SUBUNIT: RPBAI IS COMPOSED OF TWO POLYPEPTIDES.

ASSOCIATE INTO FIVE DIFFERENT TETRAMERIC ISOLECTINS. THE A4 COMBINATION IS THE ONLY ONE DEVOLD OF AGGLOTINATION ACTIVITY.

ISOFORM B4 DISPLAYS MAXIMAL AGGLOTINATION ACTIVITY.

-!- TISSUE SPECIFICITY: MOSTLY IN THE AXIAL AND RAY PARENCHYMAL CELLS OF THE INNER BARK. FEWER IN THE AXIAL AND RAY PARENCHYMAL CELLS OF THE INNER BARK. FEWERSION IN BARK. THE LECTIN ACCUMULATES IN THE INNER BARK IN AUTUMN AND WINNER AND DISAPPEARS IN MAY.

-!- SIMILARITY: TO OTHER LEGUMINOUS LECTINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     62 SMA-VSSFETNLTIQISTPHPYYAADGFAFFLAPHDTVIPPNSWGKFLGLYSNVFRNSPT 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ASSOCIATE INTO FIVE DIFFERENT TETRAMERIC ISOLECTINS. THE A4 COMBINATION IS THE DALFORE DEVOID OF AGGLUTINATION ACTIVITY.

TISSUE SPECIFICITY: STRONG EXPRESSION IN SEED. LOWER LEVELS IN THE FLOWER, AND THE BARK OF THE ROOTS. NO EXPRESSION IN LEAF. THE LECTIN ACCUMULATES IN THE INNER BARK IN ACCUMULATES IN THE INNER BARK IN ACCUMULATES IN THE INNER BARK IN AUTUMN.
                                                                                                                                                                                                                                                                                                                                                            -!- FUNCTION: N-ACETYL-D-GALACTOSAMINE SPECIFIC LECTIN.
-!- FUNCTION: BARK LECTINS ARE STORAGE PROTEIN THAT PROBABLY MAINTAINS STOCKS OF NITROGEN DURING DORMANT PERIOD. SELE-AGGREGATABLE MOLECULES THAT CAN BIND THEIR OWN CARBOHYDRATE SIDE CHAINS. THEY COULD ALSO PLAY A ROLE IN THE PLANT'S DEFENSE AGAINST PHYTOPHAGOUS INVERTEBRATES OR HERBIVOROUS HIGHER ANIMALS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  BARK AGGLUTININ I, POLYPEPTIDE A.

A; Title: Nucleotide sequence of CDNA for concanavalin A from Canavalia gladiata seeds A; Reference number: A60636
A; Reference number: A60636
A; Accession: A60636
A; Status: not compared with conceptual translation

A. Molecule type: mRNA
A. Residues: 1-290 < YA2>
A. Molecule the source was designated as Japanese jack bean
C. Comment: Concanavalin A is formed from its precursor by post-translational cleavage
C. Comment: Concanavalin A is formed from its precursor by post-translational cleavage
C. Superfamily: plant lectin
C. Reywords: calcium; glycoprotein; homotetramer; lectin; manganese
F. 1-29/Domain: signal sequence *status predicted < F. 148-149/Cleavage site: Asn-Val (unidentified proteinase) *status predicted
F. 152/Binding site: carbohydrate (Asn) (covalent) *status predicted
F. 163-164/Cleavage site: Asn-Ala (unidentified proteinase) *status predicted

Molecule type: protein
A. Residues: 30-41:160-173 < BOW>
A. Molecule type: protein
A. Residues: 30-41:160-173 < BOW>
C. Comment: The mature chain (see PIR:CVJB) consists of residues 164-281 followed by 30-1
the signal sequence; cleavage after asparagines at positions 148, 163, and 281 is follo
C. Superfamily: plant lectin
C. Keywords: glycoprotein
F.1-29/Domain: signal sequence #status predicted <SIG>
F.149-163/Domain: glycopeptide #status predicted <GLP>
F.148-149/Cleavage site: Asn-Val (unidentified proteinase) #status experimental
F.152-Binding site: carbohydrate (Asn) (covalent) #status experimental
F.152-Binding site: Asn-Ala (unidentified proteinase) #status experimental
F.163-164/Cleavage site: Asn-Glu (unidentified proteinase) #status experimental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A; Accession: A60780

agglutinin II precursor - black locust
N;Alternate names: lectin
C;Species Robinia pseudoacacia (black locust)
C;Date: 19-Mar-1997 #sequence_revision 19-Mar-1997 #text_change 07-May-1999
C;Accession: S62691; S62686
C;Accession: S62691; S62686
R;Van Damme, E.J.M.; Barre, A.,; Rouge, P.; van Leuven, F.; Peumans, W.J.
Plant Mol. Biol. 29, 1197-1210, 1995
A;Title: The seed lectins of black locust (robinia pseudoacacia) are encoded by two g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A, Title: A unique amino acid sequence involved in the putative carbohydrate-binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             C; Superfamily: plant lectin
